This map illustrates satellite-detected potential damaged structures in the area of Fayzabad in Badakhshan province, Afghanistan, located at approximately 100 kilometers north of the epicenter of the 26 October 2015 earthquake. Using a Pleiades satellite image acquired 26 October 2015 and a WorldView-3 image acquired 30 June 2015, UNITAR – UNOSAT identified 79 potentially damaged structures. Specifically, 4 potentially damaged structures are located in the city of Fayzabad and 75 on the outskirts of the city and settlements in the area of Fayzabad. This is a preliminary analysis and has not yet been validated in the field. Please send ground feedback to UNITAR – UNOSAT.

See inset for close-up view of Potentially damaged structures.
