This map illustrates satellite-detected areas of flood waters and flood affected land around the northern portion of Phnom Penh, Cambodia. Seasonal floods have caused heavy flooding in the region. The arrival of Typhoon Nari increased the heavy rains resulting in flashfloods. It is likely that flood waters have been systematically underestimated along highly vegetated areas along main river banks, and within built-up urban areas because of the special characteristics of the satellite data used. This analysis has not yet been validated in the field. Please send ground feedback to UNITAR UNOSAT.

FLOOD WATERS OVER NORTHERN PHNOM PENH, CAMBODIA
Analysis with Pleiades Data Acquired 22 October 2013 & DMC Data Acquired 01 February 2013
