This map illustrates satellite-detected surface waters in Province 2 of Nepal as observed from a Radarsat-2 image acquired on 14 July 2020 due to the current monsoon rains. Within the analyzed area of about 2,000 km², a total of about 50 km² of lands appear to be flooded.

This is a preliminary analysis and has not yet been validated in the field. Please send ground feedback to UNITAR - UNOSAT.

Important Note: Flood analysis from radar images may underestimate the presence of standing waters in built-up areas and densely vegetated areas due to backscattering properties of the radar signal.

Legend
- Village
- Town
- Secondary road
- International boundary
- District boundary
- Reference water
- Satellite detected water [14 July 2020]
- Satellite detected water [13 July 2020]
