This map illustrates areas of damage in the northeastern region of Kech District in Pakistan resulting from the earthquake occurring 24 September 2013. Using a satellite image acquired 7 October 2013 by the WorldView-2 satellite UNOSAT reviewed the area for possible damage. In the multiple towns and villages within the area analyzed, UNOSAT located 83 structures identified as destroyed an additional 50 structures possibly damaged. Possibly damaged structures lacked definitive indications of earthquake damage and instead may have been damaged by floods, ablation, or other causes. This is a preliminary analysis and has not yet been validated in the field. Please send ground feedback to UNITAR / UNOSAT.
