This map illustrates satellite detected waters and the related potentially affected croplands as deduced using a satellite Kanopus-V image acquired on 22 September 2021 over Aj Jabalain District, White Nile State of Sudan. The water extent appears to have decreased of about 230 km² since 12 September 2021. In this area, about 64 km² of croplands appear to be likely affected by the flood waters.

This is a preliminary analysis and has not yet been validated in the field. Please send ground feedback to United Nations Satellite Centre (UNOSAT)
